# Concentrator – Definition

► **Pinsker (1973):**

*a concentrator is a circuit with  $n$  inputs and  $m \leq n$  outputs that can route any given number  $k \leq m$  of valid inputs to some  $k$  of its  $m$  outputs*

- theoretical size  $O(n)$
- theoretical depth  $O(\log(n))$
- applications: interconnection networks, communication lines etc.

# Concentrator – Practical Implementations

▶ **M. Chien and A. Oruç (1994):**

- ▶ [sorter as concentrators](#)
- ▶  $O(\log(n)^2)$  depth
- ▶  $O(n \log(n))$  size (in terms of comparators)

▶ **Narasimha (1994):**

- ▶ [permutation networks as concentrators](#)  
(reverse banyan flip shuffle permutation network with butterfly)
- ▶  $O(n)$  depth
- ▶  $O(n \log(n))$  size

- Which other permutation networks could be used as concentrators?
- Are there some that can be configured faster, e.g. in time  $O(\log(n)^2)$ ?

# Narasimha's Concentrator

► RB-FS-BF permutation network

►  $n=8$

► input binary vector:  $\vec{x} = (x_0, \dots, x_7)$

► output binary vector:  $\vec{z} = (z_4, \dots, z_7)$

► permuted output:  $\vec{y} = (y_0, \dots, y_7)$

# Example 1

- ▶ RB-FS-BF permutation network
- ▶ (8,4)-concentrator:  $n=8, m=4$
- ▶  $k=2$
- ▶ input binary vector  $= (1, 1, 0, 0, 0, 0, 0, 0)$
- ▶ output binary vector  $= (0, 0, 1, 1)$

## Example 2

► RB-FS-FS permutation network

# Example 2

- ▶ RB-FS-FS permutation network
- ▶ (8,4)-concentrator:  $n=8, m=4$
- ▶  $k=2$
- ▶ input binary vector  $= (1, 1, 0, 0, 0, 0, 0, 0)$
- ▶ output binary vector  $= (0, 1, 0, 1)$

# Example 3

- ▶ RB-FS-MR permutation network
- ▶  $n=8, m=4$
- ▶  $k=2$
- ▶ input binary vector  $= (1, 1, 0, 0, 0, 0, 0, 0)$
- ▶ output binary vector  $= (1, 0, 0, 0)$
- ▶ it is not an  $(8, 4)$ -concentrator

# Analysis of Permutation Networks

- ▶ network to boolean equations

$$\vec{y} = \text{Net}_f(\vec{s}, \vec{x})$$

- ▶  $\vec{x}$  - input variables
  - ▶  $\vec{s}$  - switch configuration
  - ▶  $\vec{y}$  - output variables
- ▶ possible permutations

$$\text{Perm}_f(\vec{x}, \vec{y}) :\Leftrightarrow \exists \vec{s}. \vec{y} = \text{Net}_f(\vec{s}, \vec{x})$$

- ▶ existential quantification over the variables  $\vec{s}$
- ▶  $\text{Perm}_f(\vec{x}, \vec{y})$  - permutation predicate for network  $f$
- ▶  $\text{Perm}_f(\vec{x}, \vec{y})$  relates those  $(x,y)$  where  $x$  can be routed to  $y$

# Example

Reverse Banyan Butterfly (RB – BF)

$$\begin{aligned}
 y_0 &:= (s_{0,2} \Rightarrow (s_{1,1} \Rightarrow (s_{3,0} \Rightarrow x_7 \mid x_6) \mid (s_{1,0} \Rightarrow x_3 \mid x_2))) \mid (s_{0,1} \Rightarrow (s_{2,0} \Rightarrow x_5 \mid x_4) \mid (s_{0,0} \Rightarrow x_1 \mid x_0))) \mid (s_{0,0} \Rightarrow x_1 \mid x_0))) \\
 y_1 &:= (s_{0,2} \Rightarrow (s_{0,1} \Rightarrow (s_{2,0} \Rightarrow x_5 \mid x_4) \mid (s_{0,0} \Rightarrow x_1 \mid x_0))) \mid (s_{1,1} \Rightarrow (s_{3,0} \Rightarrow x_7 \mid x_6) \mid (s_{1,0} \Rightarrow x_3 \mid x_2))) \\
 y_2 &:= (s_{1,2} \Rightarrow (s_{1,1} \Rightarrow (s_{1,0} \Rightarrow x_3 \mid x_2) \mid (s_{3,0} \Rightarrow x_7 \mid x_6))) \mid (s_{0,1} \Rightarrow (s_{0,0} \Rightarrow x_1 \mid x_0) \mid (s_{2,0} \Rightarrow x_5 \mid x_4))) \\
 y_3 &:= (s_{1,2} \Rightarrow (s_{0,1} \Rightarrow (s_{0,0} \Rightarrow x_1 \mid x_0) \mid (s_{2,0} \Rightarrow x_5 \mid x_4))) \mid (s_{1,1} \Rightarrow (s_{1,0} \Rightarrow x_3 \mid x_2) \mid (s_{3,0} \Rightarrow x_7 \mid x_6))) \\
 y_4 &:= (s_{2,2} \Rightarrow (s_{3,1} \Rightarrow (s_{3,0} \Rightarrow x_6 \mid x_7) \mid (s_{1,0} \Rightarrow x_2 \mid x_3))) \mid (s_{2,1} \Rightarrow (s_{2,0} \Rightarrow x_4 \mid x_5) \mid (s_{0,0} \Rightarrow x_0 \mid x_1))) \\
 y_5 &:= (s_{2,2} \Rightarrow (s_{2,1} \Rightarrow (s_{2,0} \Rightarrow x_4 \mid x_5) \mid (s_{0,0} \Rightarrow x_0 \mid x_1))) \mid (s_{3,1} \Rightarrow (s_{3,0} \Rightarrow x_6 \mid x_7) \mid (s_{1,0} \Rightarrow x_2 \mid x_3))) \\
 y_6 &:= (s_{3,2} \Rightarrow (s_{3,1} \Rightarrow (s_{1,0} \Rightarrow x_2 \mid x_3) \mid (s_{3,0} \Rightarrow x_6 \mid x_7))) \mid (s_{2,1} \Rightarrow (s_{0,0} \Rightarrow x_0 \mid x_1) \mid (s_{2,0} \Rightarrow x_4 \mid x_5))) \\
 y_7 &:= (s_{3,2} \Rightarrow (s_{2,1} \Rightarrow (s_{0,0} \Rightarrow x_0 \mid x_1) \mid (s_{2,0} \Rightarrow x_4 \mid x_5))) \mid (s_{3,1} \Rightarrow (s_{1,0} \Rightarrow x_2 \mid x_3) \mid (s_{3,0} \Rightarrow x_6 \mid x_7)))
 \end{aligned}$$

# Example

Reverse Banyan Butterfly (RB – BF)

$y_0 := (s_{0,2} \Rightarrow (s_{1,1} \Rightarrow (s_{3,0} \Rightarrow x_7 \mid x_6) \mid (s_{1,0} \Rightarrow x_3 \mid x_2)) \mid (s_{0,1} \Rightarrow (s_{2,0} \Rightarrow x_5 \mid x_4) \mid (s_{0,0} \Rightarrow x_1 \mid x_0))) \mid (s_{1,1} \Rightarrow (s_{3,0} \Rightarrow x_7 \mid x_6) \mid (s_{0,1} \Rightarrow (s_{0,0} \Rightarrow x_1 \mid x_0) \mid (s_{2,0} \Rightarrow x_5 \mid x_4))) \mid (s_{1,0} \Rightarrow x_3 \mid x_2)))$

5. Conclusions and Future Work

## Sorter

for every input  $k$ -vector

- ▶  $\{z_0, \dots, z_{n-k-1}\}$ : contains the zeros
- ▶  $\{z_{n-k}, \dots, z_{n-1}\}$ : contains the ones

## Sorter

for every input  $k$ -vector

- ▶  $\{z_0, \dots, z_{n-k-1}\}$ : contains the zeros
- ▶  $\{z_{n-k}, \dots, z_{n-1}\}$ : contains the ones

$$\text{Sorted}(\vec{z}) :\Leftrightarrow \bigwedge_{i=0}^{n-2} \left( z_i \rightarrow \bigwedge_{j=i+1}^{n-1} z_j \right)$$

# Example

RB-FS+BF  
(sorter and concentrator)

RB-FS+FS  
(concentrator, but not a sorter)

# Sorting and Concentrating with a Given Permutation

## ► **sorting**

$$\text{SortedInputs}_{\pi}(\vec{x}) :\Leftrightarrow \exists \vec{y} \exists \vec{z}. \text{Perm}_f(\vec{x}, \vec{y}) \wedge \text{Sorted}(\vec{z}) \wedge \vec{z} = \pi(\vec{y})$$

- $\text{SortedInputs}_{\pi}(\vec{x})$  holds if  $\vec{x}$  can be sorted with output permutation  $\pi$
- must be true for all input vectors  $\vec{x}$  with output permutation  $\pi$

# Sorting and Concentrating with a Given Permutation

## ▶ sorting

$$\text{SortedInputs}_\pi(\vec{x}) :\Leftrightarrow \exists \vec{y} \exists \vec{z}. \text{Perm}_f(\vec{x}, \vec{y}) \wedge \text{Sorted}(\vec{z}) \wedge \vec{z} = \pi(\vec{y})$$

- ▶  $\text{SortedInputs}_\pi(\vec{x})$  holds if  $\vec{x}$  can be sorted with output permutation  $\pi$
- ▶ must be true for all input vectors  $\vec{x}$  with output permutation  $\pi$

## ▶ concentrating

$$\text{CnctrInputs}_\pi^m(\vec{x}) :\Leftrightarrow \text{MaxValid}(m, \vec{x}) \rightarrow \exists \vec{y} \exists \vec{z}. \text{Perm}_f(\vec{x}, \vec{y}) \wedge \neg \bigvee_{i=0}^{n-m-1} z_i$$

- ▶  $\text{MaxValid}(m, \vec{x})$  means: at most  $m$  of the entries of  $\vec{x}$  are valid
- ▶  $\text{CnctrInputs}_\pi^m(\vec{x})$  holds if  $\vec{x}$  can be routed to an output  $\vec{z}$  such that the valid bits of  $\vec{z}$  are in  $\{z_{n-m}, \dots, z_{n-1}\}$
- ▶ must be true for all input vectors  $\vec{x}$  with output permutation  $\pi$

# Determining Output Permutation

- ▶ computing BDDs for  $\text{NumValidOutputs}(k, \vec{y})$  for  $k = 1, \dots, n - 1$

$$\text{NumValidOutputs}(k, \vec{y}) :\Leftrightarrow \forall \vec{x}. \text{NumValid}(k, \vec{x}) \rightarrow \text{Perm}_f(\vec{x}, \vec{y})$$

- ▶ selecting an arbitrary model for  $\text{NumValidOutputs}(1, \vec{y})$  where some variable  $y_{i_{n-1}}$  is true as  $z_{n-1}$
- ▶ check whether there is a model for  $\text{NumValidOutputs}(2, \vec{y})$  where another variable  $y_{i_{n-2}}$  is true in this BDD, if so, we can pick one of these variables as  $z_{n-2}$

# Example

Permutation	0	1	2	3	4	5	6	7
PS := PerfectShuffle	0	2	4	6	1	3	5	7
FS := FlipShuffle	0	4	1	5	2	6	3	7
BF := Butterfly	0	4	2	6	1	5	3	7
MR := Mirror	7	6	5	4	3	2	1	0
RM := RevMirror	7	3	5	1	6	2	4	0
<b>OP := OutputPerm</b>	<b>7</b>	<b>0</b>	<b>5</b>	<b>2</b>	<b>3</b>	<b>4</b>	<b>1</b>	<b>6</b>

- ▶ here, we consider input vectors with 2 valid bits
- ▶ they must be routed to output  $z = (0, \dots, 0, 1, 1)$  for sorting
- ▶ the BDD tells us that permutations must map e.g.  $y_0, y_7$  to  $z_7, z_6$

## Example

Permutation	0	1	2	3	4	5	6	7
PS := PerfectShuffle	0	2	4	6	1	3	5	7
FS := FlipShuffle	0	4	1	5	2	6	3	7
BF := Butterfly	0	4	2	6	1	5	3	7
MR := Mirror	7	6	5	4	3	2	1	0
RM := RevMirror	7	3	5	1	6	2	4	0
OP := OutputPerm	7	0	5	2	3	4	1	6

- ▶ here, we consider input vectors with 3 valid bits
- ▶ they must be routed to output  $z = (0, \dots, 0, 1, 1, 1)$  for sorting
- ▶ the BDD tells us that permutations must map e.g.  $y_0, y_7, y_5$  to  $z_7, z_6, z_5$
- ▶ none of the above permutations can do that
- ▶ backtrack and find another permutation

# Example

Permutation	0	1	2	3	4	5	6	7
PS := PerfectShuffle	0	2	4	6	1	3	5	7
FS := FlipShuffle	0	4	1	5	2	6	3	7
BF := Butterfly	0	4	2	6	1	5	3	7
MR := Mirror	7	6	5	4	3	2	1	0
RM := RevMirror	7	3	5	1	6	2	4	0
OP := OutputPerm	7	0	5	2	3	4	1	6

- ▶ here, we consider again input vectors with 3 valid bits
- ▶ they must be routed to output  $z = (0, \dots, 0, 1, 1, 1)$  for sorting
- ▶ the BDD tells us that permutations must map e.g.  $y_7, y_3, y_5$  to  $z_7, z_6, z_5$  (like BF)

# Example

Permutation	0	1	2	3	4	5	6	7
PS := PerfectShuffle	0	2	4	6	1	3	5	7
FS := FlipShuffle	0	4	1	5	2	6	3	7
BF := Butterfly	0	4	2	6	1	5	3	7
MR := Mirror	7	6	5	4	3	2	1	0
RM := RevMirror	7	3	5	1	6	2	4	0
OP := OutputPerm	7	0	5	2	3	4	1	6

- ▶ finally, we extend it to input vectors with 4 valid bits
- ▶ they must be routed to output  $z = (0, \dots, 0, 1, 1, 1, 1)$  for sorting
- ▶ the BDD tells us that permutations must map e.g.  $y_7, y_3, y_5, y_1$  to  $z_7, z_6, z_5, z_4$  (like BF)

# Experimental Results

	MS	RB	BY
PS	✓(S1)	–	✓(S1)
FS	✓(S2)	✓(S1)	–
BF	–	✓(S1)	✓(S2)
MR	–	–	–
RM	–	✓(S1)	✓(S2)
OP	–	✓(S1)	✓(S3)

- ▶ we found three BDD sequences  $S_1, S_2, S_3$
- ▶ these correspond with three classes of potential output permutations for sorting and concentrating
- ▶ we made also a full analysis over all  $8!$  permutations for 8 inputs

# Outline

1. Introduction
2. Permutation Networks
3. Analysis of Permutation Networks
4. Analyzing Sorting and Concentration Properties
5. Conclusions and Future Work

# Conclusions and Future Work

## **conclusions:**

- ▶ Narasimha showed that RB-FS-BF can be configured as sorter and as concentrator
- ▶ with our method, one can verify which other networks can alternatively be used

## **future work:**

- ▶ determine the control logic of the switches
- ▶ determine minimal number of required switches

# The End

Thank you for your attention.
